                                      diseases or a predisposition to cell-mediated diseases, which is effected by administering an autoreactive substance intradermally and establishing the diagnosis on the basis of the occurrence or lack of a positive reaction at the site of administration. The method is used for diagnosis of autoimmune and tumour diseases, preferably T-cell-mediated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R88667 is derived from residues 266-290 of human glutamic acid decarboxylase and specifically reacts with a T-cell sub-population isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. this peptide and those shown in R88668 and R76642-62, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that
                                                                                                             W18842-70 are peptide fragments of the 65 kD human glutamic acid decarboxylase (GAD). The fragments are autoreactive substances used for diagnosis of insulin-dependent diabetes mellitus (IDDM). The diagnosis is determined by using a claimed method for diagnosis of cell mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W18848;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1;

                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administrating a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoconal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are

These fragments can be used to detect autoantibodies against GAD, e.g. to diagnose and treat GAD-related autoimmune disorders, such as insulin dependant diabetes mellitus or stiff man disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide fragments of glutamic acid decarboxylase - for diagnosis and treatment of auto:immune disease, esp. Insulin dependent diabetes, also related nucleic acid, vectors, antibodies, hybridoma(s) etc.
             Ameliorating glutamic acid decarboxylase associated autoimmune disorders such as insulin dependent diabetes mellitus and Stiff man disease
                                                                             Tobin

Amino acid sequences Y57063-Y57091 are examples of neglected target tissue antigens (Whole antigens or fragments) not involved in autoimmunity. These peptides and proteins are used in the method of the invention which involves administering an NTTA as an antigen based immunotherapeutic agent, to a host affilted with an autoimmune response associated with an autoimmune disease. The immunotherapeutic agent is used to treat autoimmune diseases such as insulin dependent diabetes mellitus, unlitiple sclerosis, autoimmune thyroiditis, uveoretinitis, rheumatoid arthritis or abnormal inflammatory immune responses. The NTTA induces regulatory tolerance by elicitation of regulatory T cells among T cells recognizing the NTTA but not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a fragment of the glutamic acid decarboxylase 65 (GAD65) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering aGAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in immunoassays. GAD65 is an effective diagnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neglected target tissue antigen; NTTA; autoimmunity; autoimmune response; immunotherapeutic agent; insulin dependent diabetes mellitus; multiple sclerosis; autoimmune thyroiditis; rheumatoid arthritis; uveoretinitis; inflammatory response.

participating in the immune response. The NTTA are capable of recognition by substantial populations of uncommitted T cells which can be primed, or blased, towards regulatory responses to provide effective treatment. The NTTA are effective in regulating undesirable immune responses even when target determinants used as agents promoting tolerance agents have failed to induce an effective regulatory T cell response. NTTAs as agents promoting tolerance are anticipated to be safer than use of target

Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and autoimmune disease

Disclosure; Page 42; 51pp; English

w85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostat or condyloma acuminatum). Helper T-cell induce a helper T cell response, e.g. peptides may be used in cases of autoimmum prostate ç for

Sequences Y73087-Y73102 represent hepatitis C virus (HCV)-derived MHC class II (HTL) epitopes which are claimed for use in the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper T lymphocyte (HTL) epitopes,

The present peptide is an antigenic peptide (AP), derived from the C-terminal region of the hepatitis C virus (HCV) non-structural protein 4 (NS4). The AP was prepd. using FMOC chemistry, and can be used in a claimed method for the differential diagnosis of HCV. One, two or three of the peptides W01980-82 are separately contacted with an antibody (Ab) conty. sample, and the binding between the peptide(s) and the Ab determined. The Ab conty. sample is then contacted with the peptide W01983, and the binding between the peptide and the Ab determined. The strength of the binding between the peptide(s) and the Ab in the two assays is compared, where stronger binding in the 1st assay is indicative of acute HCV infection, and equivalent binding is indicative of chronic HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or a cytotoxic T lymphocyte (CTL) epitope and a universal HTL epitope such as a pan DR epitope (PADRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in assaying the human immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HCV)) bacteria, protozoa (e.g., plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                  (USSH)

                                        Sequences Y73087-Y73102 represent hepatitis C virus (HCV)-derived MHC class II (HTL) epitopes which are claimed for use in the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric; pan DR epitope; expression vector; parting; peptide; promoter; major histocompatibility complex; MHC; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endopytic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTL; immune typonse; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HTV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell;
              epitopes may comprise either helper T lymphocyte (HTL) epitopes, or a cytotoxic T lymphocyte (CTL) epitope and a universal HTL

They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HCV)) bacteria, protozoa (e.g., plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                  The synthetic peptide corresponds to residues 1917-1940 of the domain of HCV. The peptide may be used for the sensitive and specific detection of HCV infection Antibodies raised against peptide can be used for passive immuno-prophylaxis and the HCV antigens can be used in vaccines to prevent HCV infection.
                                                                                                                                                                                                                                                                                                                                                              Detection of hepatitis C virus antigens - using antibody bound to solid support and competitive % \left( 1\right) =\left\{ 1\right\}

CC two-dimensional array of features. The method can be used for screening, condingnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (b) dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen comprises and (c) comparing the abundance of each chosen feature in the sample of sample with the abundance of that chosen feature in serum or plasma from comparing the abundance of each chosen feature in the sample indicates the presence or absence of cohosen feature or features in the sample indicates the presence or absence of RA; and (c) compositives in the sample indicates the presence or absence of RA; in the subject. The method can also be used in clinical consisting for testing drugs for therapy of RA, for purification of RA; and (a) compositic protein isoforms (RPIS), and for production of antibodies to compounds that promote or inhibit their activity, which are then used as composition of the present activity, which are then used as composition of a consisting represent expression reference protein isoform peptides, v42101 to v42103 consistence of the present invention.

CC 25068 represent degenerate probes for RPIS, which are all used in cc the exemplification of the present invention. A method has been developed for the diagnosis of human rheumatoid 0;

                                                                                                                                                                                                                                                                                                                                                w85284-451 represent helper T-cell class II peptides, which can bind the human leucocyte antigens (HIA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or pervention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prosta cancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, and per prosta pedicarrieries and second and per the case of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, and fond

histocompatibility complex (MHC) targetting sequence, and two or more heterologous peptide epitopes. The MHC targetting sequence may be a class I targetting sequence, which directs an MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which directs extracellular antigens to enter the endocytic pathway to be processed into antigen peptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper I lymphocyte (HTL) epitopes, or a cytotoxic I lymphocyte (CTL) epitope and a universal HTL epitope such as a pan DR epitope (PADE). The vectors are useful for interior and interior as a pan DR epitope (PADE).
for stimulating an immune response in vivo, as well as for use in assaying the human immunogenicity of a human T cell peptide epitope in vivo in a non-human mammal. They provide a nucleic acid vaccine for enhancing immunity against infectious pathogens, such as viruses (e.g., HIV, hepatitis B (HBV and hepatitis C (HCV)) bacteria, protozoa (e.g., plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences Y73087-Y73102 represent hepatitis C virus (HCV)-derived MHC class II (HTL) epitopes which are claimed for use in the present invention. The invention relates to a novel expression vector comprising a promoter operably linked to a fusion gene encoding a major
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  promoter; major histocompatibility complex; MHG; targetting; peptide; epitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTL; immune response; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HIV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             hepatitis B; hepatitis C; bacterium; protozoan; tumour cautoimmune disease; activation; antiviral; antimalarial;

                                                                                                                                                                                                                    The inventors claim a polypepide having a mol. wt. of about 35kd-42kd and having at least one of the SQ in p60743-p60746. In p60743-p60746, X in the SQ corresp. to an AA such that the SQ is substantially the same as a polypeptide expressed by an HTLV, esp. HTLV-I or HTLV-II (see p60747-p60749). Also claimed is a polypeptide having a mol. wt. of not greater than about 42kd and having an AA SQ of at least 12 AAs found within at least one of the polypeptide SQ in p60743-p60746. Polypeptides encoded for in the region described as pX-IV in the X SQ of HTLV-II are characterized by being respectively about 40kd and 37kd. Detection of antibodies to these proteins in serum may be used to determine whether exposure to an HTLV-IV in the SQ COUNTER ABSOCCULTER ADSOCCULTER ABSOCCULTER ADSOCCULTER ADS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New retroviral polypeptide(s), fragments antisera and antibodies - useful for detection of retro:viruses in HTLV family, e.g. causing adult T-cell leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 2 encoded by the x-region of viruses in the HTLV family, \mathtt{HTLV}\text{-}\mathbf{I} and \mathtt{HTLV}\text{-}\mathbf{I}\mathbf{I}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and/or HTLV-I or II.

                                                                                                                                                                                                              g
                                                                                                                                                                                                                                 The peptide corresponds to a glutamic acid decarboxylase (GAD 65) sequence and may be used for the detection of autoantibodies to GAD 65. They can also be used for screening drugs such as those that alter GAD function and for generation of antibodies which can be used to detect GAD 65. Such methods can be used in the diagnosis and therapy of autoimmune diseases such as insulin dependent diabetes mellitus and "stiff man" syndrome. The polypeptide can be used to bind or block the continuance of an autoimmune response to GAD 65. It may also be coupled to therapeutic agents and used immunotherapeutically. See also R29625-9.
                                                                                                                                                                                                                                                                                                                                                                                         Glutamic acid decarboxylase isolated polypeptide(s) - useful for diagnosis and treatment of auto-immune diseases, e.g. insulin dependent diabetes mellitus, drug screening and antibody prodn.

                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is an antigen of the gp160 env precursor protein of HIV-1 group O (Outlier) strain KGT008, an isolate from Nigeria. The invention relates to new HIV-1 group O antigens (see v0546-625), and the use of these antigens, or nucleic acids encoding them (see X25154-80), in the diagnosis and prophylaxis of AIDS. They can be used as reagents for detecting HIV-1 group O infection and for differentiating different types of HIV-1 group O infection. Vaccines that provide protective immunity against HIV-1 infection, in particular against HIV-1 group O infection, comprise at least one HIV-1 type O antigen, a nucleic acid encoding such an antigen, a virus-like particle comprising such an antigen, or an attenuated form of an HIV-1 type O strain. The invention also relates to new HIV-1 group O strains, mostly from patients from C Cameroon and its neighbouring countries.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an immunogenic peptide used to produce Cantibodies which will bind to the p20 region of ICH-3 from the present cinvention. The present invention describes: (1) a method for modulating programmed cell death in a cell, comprising contacting the cell with computating amounts of ICH-3; (2) a method for promoting pro-interleukin (pro-IL) 1-beta processing by a cell in the presence of IL-converting cenzyme (ICE), comprising contacting the cell with ICH-3 expressed under the control of a CMV promoter; (3) a method for stimulating synthesis of Ich-3 gene products in a cell, comprising contacting the cell with CC stimulatory amounts of Ilpopolysaccharide (LPS); (4) a monoclonal or polyclonal antibody that specifically binds to ICH-3; (5) a transgenic con-human animal, comprising a disrupted Ich-3 gene, and its progeny, and (6) a method of protecting against lung injury in common medical conditions, comprising utilising inhibitors of the pathway of apoptosis. The transgenic animal is used as model for the study of septic shock or infection. It is also used for screening for folliculogenic compounds or usceptibility to infection. Inhibitors of ICH-3 are used to reduce
                                                                                                                                                                                                                                                                                                                                                                     Query Match

The sequences given in R49291-505 and R46981-7038 represent peptide fragments of naturally-occuring immunomodulatory proteins. These fragments are between 10-30 residues in length and bind to a human major histocompatibility complex (MMC) class II allotype. These peptides may be used for therapy of autoimmune diseases, such as
                                                                                                                                                                                                                                                                                                                                       Naturally-occuring; immunomodulatory protein; human; therapy; class I; major histocompatibility complex; class II; allotype; type I diabetes; autoimmune disease; rheumatoid arthritis; T-cell-mediated response; mutiple sclerosis; transplant rejection; vaccine; MHC.

                                                                                           This sequence is a fragment of the AV37 antigen protein of the invention. The protein is recognised by a monoclonal antibody (MAb) secreted by the hybridoma AV37 deposited at the European Collection of Cell Cultures (ECACC) accession number 98030304. The polypeptide can be used to isolate a MAb, produce a hybridoma producing the MAb, and in a composition for use as a vaccine. The vaccine can be used against oncogenic avian viruses, including Marek's disease virus, avian leucosis virus, Rous-associated virus and reticuloendotheliosis virus. The vector can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              type I diabetes, rheumatoid arthritis and mutiple sclerosis, reduce transplant rejection. They may also be used for vacci providing an exclusively T-cell-mediated response, which can class I or class II based, or both, depending on the length a character of the immunogenic peptides.

The peptide can be used to treat or prevent a wasting syndrome associated with viral infection, e.g. human immunodeficiency syndrome virus infection, cancer, chronic cardiovascular disease, chemotherapy or radiation
                    Beta-chain; human; chorionic gonadotrophin; beta-hCG; inhibition; human immunodeficiency virus; HIV; infection; replication; Kaposi's sarcoma; haematopoiesis.

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score

Submitted (NOV-1994) to the EMBL/GenBank/DDBJ databases.

FUNCTION: MEMBER OF CAK WHICH ACTIVATES CYCLIN-ASSOCIATED CDC2/CDK2/CDK4 BY THREONINE PHOSPHORYLATION. ITS EXPRESSION AND ACTIVITY ARE CONSTANT THROUGHOUT THE CELL CYCLE. CAK IS TIGHTLY ASSOCIATED WITH A MULTIPROTEIN COMPLEX TFIIH, WHICH PLAYS A DUAL ROLE IN TRANSCRIPTION AND DNA REPAIR (BY SIMILARITY).

ROLE IN TRANSCRIPTION AND DNA REPAIR (BY SIMILARITY).

1- SUBURIT: MAMMALIAN CAK CONTAINS THREE COMPONENTS: CDK7, CYCLIN HAND AN ASSEMBLY FACTOR CALLED MATI.

-1- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

PATHWAY: 3-CHLOROCATECHOL DEGRADATION (BETA-KETOADIPATE PATHWAY).

THIS PATHWAY SERVES A VITAL ROLE IN THE BIODEGRADATION OF TOXIC AROMATIC COMPOUNDS INTRODUCED IN THE ENVIRONMENT BOTH AS NATURAL PRODUCTS AND AS INDUSTRIAL EFFLUENT.

SIMILARITY: BELONGS TO THE IRON-CONTAINING ALCOHOL DEHYDROGENASE FAMILY.
                                                                                                                                                                                                                                       22

                                                                                                                                                                                                                                                                 ö
                                             decarboxylase and specifically reacts with a T-ceil sub-population isolated from recently diagnosed Type-1 diabetics. Pharmaceutical compens. contg. this peptide and those shown in R88667 and R76642-62, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-ceil subpopulations that are then used for antigen prodn., e.g. by reinjection.
                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                   This sequence represents a fragment of the glutamic acid decarboxylase 65 (62056) protein. The invention relates to a method of ameliorating GAD associated autoimmune disorders by administering a GAD65 peptide to the patient. The method can be used for ameliorating GAD associated autoimmune disorders such as IDDM (insulin dependent diabetes mellitus) and Stiff man disease. GAD65 can also be useful for screening drugs that alter GAD function, for generating monoclonal antibodies and in amunocassays. GAD65 is an effective diapnostic tool for predicting IDDM and the diagnosis is quite easy. It is also possible to obtain much larger quantities of polypeptide via recombinant techniques than are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
Ameliorating glutamic acid decarboxylase associated autoimmune disorders such as insulin dependent diabetes mellitus and Stiff man

```
specifically react with T-cell sub-populations isolated from recently diagnosed Type-I diabetics. Pharmaceutical compsns. contg. these peptides and those shown in R88668-72, are useful for the diagnosis of a disease or predispositions of immune system diseases, tumours, and autoimmune diseases, including diabetes. The peptides are able to detect specific T-cell subpopulations that are then used for antigen prodn.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GAD; 65 kD; human; glutamic acid decarboxylase; autoreactive; diagnosis; insulin-dependent diabetes mellitus; IDDM; cell-mediated disease; predisposition; autoimmune; tumour; rheumatoid arthritis; multiple sclerosis.
